

COMPX307-21B Programming Languages

First coursework

The first few questions of this coursework are intended to get you started using the interpreter with some simple definitions. There are some larger problems later on in the coursework. I strongly suggest that you read through my “elementary” notes on Haskell, accessible from the course Moodle site, since some of the questions refer to ideas in those notes which we may not yet have covered in the lectures.

1. Create a file called `ex1.hs` and type in the following definitions:

```
twice f x = f (f x)
square n = n * n
naturals = [0..]
ones = 1 : ones
```

and then load this file using the `load` command. Once the file is loaded, try to answer the following questions:

- a. What is the type of `twice`?
 - b. What is the value of `twice not False`?
 - c. what is the type of `square`? Why is it that?
 - d. what is the type of `twice square`? Why is it that?
 - e. what is the value of `twice square 5`?
 - f. what is the type of the pre-defined function `head`?
 - g. what is the type of `head naturals`?
 - h. what is the value of `head naturals`?
2. What is the type of `(3 *)`?
 3. What value (remember that functions are values) does `(* 3)` have?
 4. What expression, using only the function `square` and the number 3, has the value 81?
 5. What expression, using only the list `naturals`, the function `(2 *)` and the function `map`, represents the list of all even natural numbers?
 6. Define a function

```
capitalize :: Char -> Char
```

which given any alphabetic character returns its capital form. On numbers and punctuation it should leave the character alone.

You will find the definitions

```
ord :: Char -> Int
ord = fromEnum
```

```
chr :: Int -> Char
chr = toEnum
```

useful. So,

```
capitalize 'a' = 'A'
capitalize 'e' = 'E'
capitalize 'D' = 'D'
capitalize '{' = '{'
capitalize '3' = '3'
```

7. Using only the pre-defined function `map` and the function `capitalize` you gave in question eight, define a function

```
capitalize_string :: String -> String
```

which takes a string and applies `capitalize` to each element. So,

```
capitalize_string "Hello, Steve" = "HELLO, STEVE"
capitalize_string "Happy Birthday on the 31st" =
    "HAPPY BIRTHDAY ON THE 31ST"
```

8. Using only `foldr`, the Boolean operation `(||)` and `False`, define a function

```
or_list :: [Bool] -> Bool
```

so that

```
or_list [b1, b2,...,bn] = b1 || b2 || ... || bn
```

and

```
or_list [] = False
```

You will need to make sure you give a type statement in your definition, otherwise there will be a long type-error message for you to disentangle!

9.
i. Define, using only a list comprehension with a single generator, the list `[1..k]` for some `k`, the string `"sheep\n"` and the pre-defined function `concat`, a function

```
flock :: Integer -> String
```

which, when given a number, say five, as argument, is such that

```
putStr (flock 5)
```

gives

```
sheep
sheep
sheep
sheep
sheep
```

i.e. five sheep, one on each line, as value.

ii. Now define

```
flock2 :: Integer -> String
```

which does the same thing but WITHOUT using a list comprehension, but using anything else you like.

iii. Using only a list comprehension, the string "sheep ", a list of natural numbers (not necessarily all of them...) and the pre-defined function `concat`, define the function

```
a_row_of_sheep :: Integer -> String
```

so that `a_row_of_sheep 5`, for example, has value

```
sheep sheep sheep sheep sheep
```

iv. By using the ideas in your answers to i and iii and composing them together in a suitable way, define a function

```
big_flock :: Integer -> String
```

so that `putStr (big_flock 5)`, for example, has value

```
sheep
sheep sheep
sheep sheep sheep
sheep sheep sheep sheep
sheep sheep sheep sheep sheep
```

Your answers for all the questions above are due at 1000 on Friday 30th July 2021.

You must submit your answers as a plain text file via Moodle. This **MUST** be a plain text file (**not** a PDF, **not** a MS-format file or any other sort of particular format) since I will want to load your solutions and try them out in ghci.
